

Q.1 -> Which field of the Customers table is the primary key?

A.1 -> CNUM is the primary key in the customers table as it is the customer number which is the unique column in the table. The primary key in SQL is a single, or a group of fields or columns that can uniquely identify a row in a table

Q.2 -> What is the 4th column of the Customers table?

A.2 -> Rating is the 4th column of the customers table

Q.3 -> What is another word for row? For column?

A.3 -> Row is also called as tuple, record. Column is also called as attribute.

Q.4 -> Why isn't it possible to see the first five rows of a table?

A.4 -> It is not possible to see first five rows of a table because in RDBMS the records are saved on different address in the Database Server Hard Disk means that the records are fragmented. We can see first five if there is no update in the record. If the records of datatype varchar then size of the data inserted changes hence the address where it is stored previously is not enough for it then the address changes and we will not be able to get the record in same sequence.
